

NEEDLING

MICRONEEDLING

Micro medical skin needling utilises the body's self-healing mechanisms.

The intrusion of tiny surgical needles is sensed by skin nerve receptors but the needles are so fine that tissue is undamaged and the skin integrity stays intact.

The procedure stimulates the skin to regenerate and repair itself naturally and safely. This results in an increase in collagen production, which leads to smoother, brighter, healthier, younger-looking skin. As the skin barrier has been temporarily broken this can allow for the passage of products that either would penetrate more slowly or be too large to get through without help therefore the delivery of products is dramatically enhanced.

Medical needling can significantly improve the appearance of:

- Acne scars
- Aged and sun damaged skin
- Facial and décolleté lines and wrinkles
- Stretch marks
- Large pores
- Pigmentation
- Cellulite

POST-PROCEDURE CARE

Microneedling is well tolerated by patients but erythema may be seen after treatment, lasting for 2-3 days. To prevent this or strongly alleviate this the Hilotherapy will be recommended. The Hilotherapy should be used 15-20 minutes before treatment and about 30 minutes after treatment. The patient can go back to work the very next day.
